

Safe Sweden — Product Redesign Discussion

An exported ChatGPT conversation on reframing Safe Sweden from a crime-data website into a personal safety intelligence platform.

Yes — and the important realization is that you're **not really redesigning individual pages anymore**. You're redesigning the **product model** of Safe Sweden.

Your current structure sounds like:

Landing page → browse information → click into interesting pages

That naturally feels like a school/project website because the homepage is trying to show everything the application can do.

The new direction is much stronger:

Landing page → become a user → personalize → enter your private safety workspace → continuously use the platform

That is a fundamentally different product.

1. The New Product Concept

Think of Safe Sweden as a **personal/community safety intelligence platform**, rather than a website displaying Swedish crime data.

The core loop becomes:

My area → What's happening? → What does it mean? → What should I do?

The platform has three major layers:

Explore — Zones

Understand what is happening geographically.

- Crime map
- Crime list
- Filters

- Time periods
- Crime categories
- Incident details
- Area comparisons

Understand — Dashboard

Understand your safety situation.

- Watch neighborhood status
- Recent incidents around you
- Safety trends
- Relevant statistics
- Alerts
- AI-generated insights
- Important changes since your last visit

Act — AI Safety Agent

Turn information into something useful.

- Ask questions
- Summarize incidents
- Explain trends
- Identify unusual activity
- Provide actionable safety suggestions
- Potentially perform actions within the platform

That's a much more commercially interesting proposition.

2. The Landing Page Should Become Dramatically Simpler

Remove the fetched crime list from the landing page — that's likely the biggest contributor to the "school project" feeling. The landing page doesn't need to prove that you have an API. It needs to answer:

Why should I trust/use Safe Sweden?

Something closer to:

Safe Sweden

Know what's happening around you.

Stay informed about crime and safety developments in your neighborhood, understand what they mean, and get intelligent alerts when something matters to you.

[Get started] [Sign in]

Then perhaps a product visualization / dashboard preview underneath. Not "here are 10 crimes fetched from the API" — that demonstrates technical implementation. The alternative demonstrates a **product**.

3. Onboarding Becomes Extremely Important

Don't make it feel like "Register an account." Make it feel like **"Set up your personal safety profile."**

Step 1 — About you

- Name
- Email
- Password

Step 2 — Your area

Select: **Stockholm** → then **Neighborhood / area** (could eventually use a map rather than a dropdown).

Step 3 — Watch your neighborhood

Watch Neighborhood — *turn this on to receive important safety updates about your area.*

[■ Watch my neighborhood]

We'll notify you when relevant incidents or significant safety developments are reported nearby.

Step 4 — Your preferences

What would you like to receive?

- ☒ Crime alerts
- ☒ Significant safety updates
- ☒ Weekly neighborhood summary
- ☒ AI safety recommendations

Then: **[Enter Safe Sweden]**

This makes onboarding feel like the user is configuring a service, not filling out a school registration form.

4. Dashboard Should Become the Heart of the Platform

This is where the redesign can really differentiate itself. Don't make the dashboard simply statistics + charts + cards — make it answer the user's questions immediately.

Dashboard mock-up

Good morning, Marco

Your neighborhood — Kista

■ No major changes detected · Last 7 days

■ **Recent activity**

3 incidents reported near your area — crime category, location, time, distance

[\[View incidents\]](#)

■ **AI Safety Brief**

"Your neighborhood has seen fewer reported incidents this week compared with the previous week. However, vehicle-related incidents have increased slightly around..."

[\[Ask Safe Sweden AI\]](#)

■ **Neighborhood trends**

Crime activity ■ / ■ — compared with previous week, previous month, same period last year

■ **Your watch area**

Mini-map showing incidents around the user's neighborhood — [\[Explore Zones\]](#)

■ **Ask Safe Sweden**

"What would you like to know about your area?" — [Ask anything...](#)

Now the dashboard feels like an actual product people return to.

5. The Zones Page Fits Beautifully Into This Architecture

Position Zones as the **exploration layer**. Instead of "here's a map with crimes," it becomes:

Zones

Explore what's happening across Sweden.

Then a map with crimes, and alongside/below an incident feed with:

- Crime type
- Date/time

- Location
- Severity/relevance
- Status

And eventually, filters:

- Time — Today | 7 days | 30 days | Custom
- Crime — All | Theft | Assault | Burglary | etc.
- Area — Current area | Municipality | County | Sweden

This gives the page a real purpose:

Dashboard tells me what's relevant to me. Zones lets me investigate.

That's a very clean relationship.

6. The AI Idea Actually Fits Into All Three Layers

Be careful here — don't create an "AI page." AI shouldn't feel like an isolated feature. Instead:

AI is the intelligence layer of Safe Sweden.

Agent #1 — Safety Intelligence Agent

The main conversational agent.

User: "Has crime increased around Kista recently?"

Agent: "Reported incidents in Kista increased 12% over the last 30 days compared with the previous 30 days. The largest increase was in..."

Agent: "Would you like me to show the affected areas?" [Show on map]

Now you have something much more powerful than ChatGPT sitting inside a website — the agent can use the application itself.

Agent #2 — Alert / Monitoring Agent

This one doesn't necessarily need a chat UI. It works in the background, monitoring the user's Watch Neighborhood for new incidents, evaluating relevance, and notifying the user if appropriate.

■ *New incident near your neighborhood*

A burglary was reported approximately 700m from your watch area. Reported: 14:32

[View incident]

The AI can potentially determine how important/relevant an event is before generating a notification.

7. Agent #3 — Report Intelligence

This could be incredibly useful on the Zones/incident detail page. Instead of just displaying raw information for an incident:

Incident — Burglary

Kista · 13 September 2026 · 14:32

[Raw information]

Then an AI Summary:

"A burglary was reported in the Kista area during the afternoon. The available report indicates..."

Followed by an "Ask about this incident" prompt:

- "What does this mean?"
- "Is this unusual for this area?"
- "Show me similar incidents."
- "Summarize this for me."

That's a strong use of AI because it's **contextual**, rather than being a gimmicky chatbot.

8. Eventually, an AI Command Interface

This is where the idea of agents taking decisions/actions inside the app becomes particularly interesting:

- "Show me all burglaries within 2km of my neighborhood during the last month." — the agent changes the Zones filters.
- "Summarize the crime activity around my neighborhood this week." — it generates the summary.
- "Create a weekly safety report for my neighborhood." — the agent creates it.
- "Notify me only about incidents involving violent crime within 2km." — the agent configures the user's notification preferences.

Now you're moving toward an **agentic product**, not merely an AI chatbot.

9. Overall Platform Structure

Importantly, the landing page is no longer the application. It's the entrance to the application.

10. A Much Stronger Investor Story

Instead of saying:

"Safe Sweden is a full-stack application that displays Swedish crime data on a map."

You can eventually describe it as:

"Safe Sweden is a personalized safety intelligence platform that helps people understand what's happening in their communities, receive relevant safety alerts, and interact with AI agents that transform public crime data into actionable information."

That's a completely different pitch. Your existing technical work doesn't become wasted:

Crime API → Zones → Map → Statistics

becomes the **data foundation**. You're now adding:

Identity → Personalization → Monitoring → AI → Actions

on top of it.

One Thing to Do Before Coding

Don't redesign page-by-page yet. First establish the product architecture. Work through the redesign in this order:

Phase 1 — Product vision	What exactly is Safe Sweden?
Phase 2 — Information architecture	What are the actual sections/pages?
Phase 3 — User journey	Landing → onboarding → dashboard → zones → incidents → AI.
Phase 4 — Dashboard design	What information does the user actually need every day?
Phase 5 — AI architecture/UI	Where each agent appears and what actions it can perform.
Phase 6 — Zones redesign	Turn the existing Zones implementation into the proper product experience.
Phase 7 — Visual/UI system	Typography, cards, navigation, colors, spacing, interaction patterns.
Phase 8 — Implementation roadmap	Break the redesign into small, manageable development steps.

That would keep us from falling into the same trap of building a huge, impressive-looking system that becomes difficult to understand or implement.

The biggest shift:

Don't build a website that shows what Safe Sweden can do. Build a product that gives the user a reason to come back tomorrow.

That's the direction to take this redesign.
